Job role: Senior Product Design Manager, Growth

Throughout my career, I had chance working across banking, trade finance, supply chain, and payment modernization programs, where data, business processes, and financial operations intersect.

As required for payment paltform, **accounting as a core module of a payment product**, supporting the complete lifecycle of pay-in, intra-platform transfers, pay-out, and partner transfers.

Have applied this conceptual model in my own Alpha product development (DLT base product). There are further to evolve and optimize the abstraction layer to handle the complexity and diversity of multiple chains, assets, and settlement models.

Realized that instead of building product in a box by myself, we are building products for network/platform. I would be particularly interested to contribute and explore institutional-grade product suites from KOHO Financial, and to contribute to building payment and settlement infrastructure that bridges digital assets with traditional financial systems.

I'm also connecting to follow the continued growth of the KOHO ecosystem and explore potential opportunities around business development, partnerships, and community building.

Professional Brief with a case study:
